

# Methoden moderner Röntgenphysik II: Struktur und Dynamik kondensierter Materie

Vorlesung zum Haupt/Masterstudiengang Physik  
SS 2011  
G. Grübel, M. Martins, E. Weckert et al.

SemRm3, Physik, Jungiusstrasse

Di: 14:00-15:30

Do: 11:20-12:50

**S. Roth (SR)**

**21.4.2011, 28.4.2011 & 3.5.2011 finden statt**

**26.4.2011 fällt aus**

# Summary last lecture

Polymers:

➤ Macromolecules, build up of a large number of molecular units

$$\bar{M}_n = \int p(M)M dM \quad \bar{M}_w = \frac{\int p(M)M \cdot M dM}{\int p(M)M dM}$$

➤ Radius of gyration  $R_G = \sqrt{\frac{1}{M} \sum_0^N \langle m_i \bar{r}_i^2 \rangle}$

➤ Block copolymers: ..AAAABBBBBBAAAABBBBBB...

➤ Flory-Huggins-theory  $\Delta G_{mix} = -T\Delta S_t + \Delta G_{loc}$

Mixing takes place, when  $\Delta G_{mix} < 0$

Flory-Huggins-parameter  $\chi$

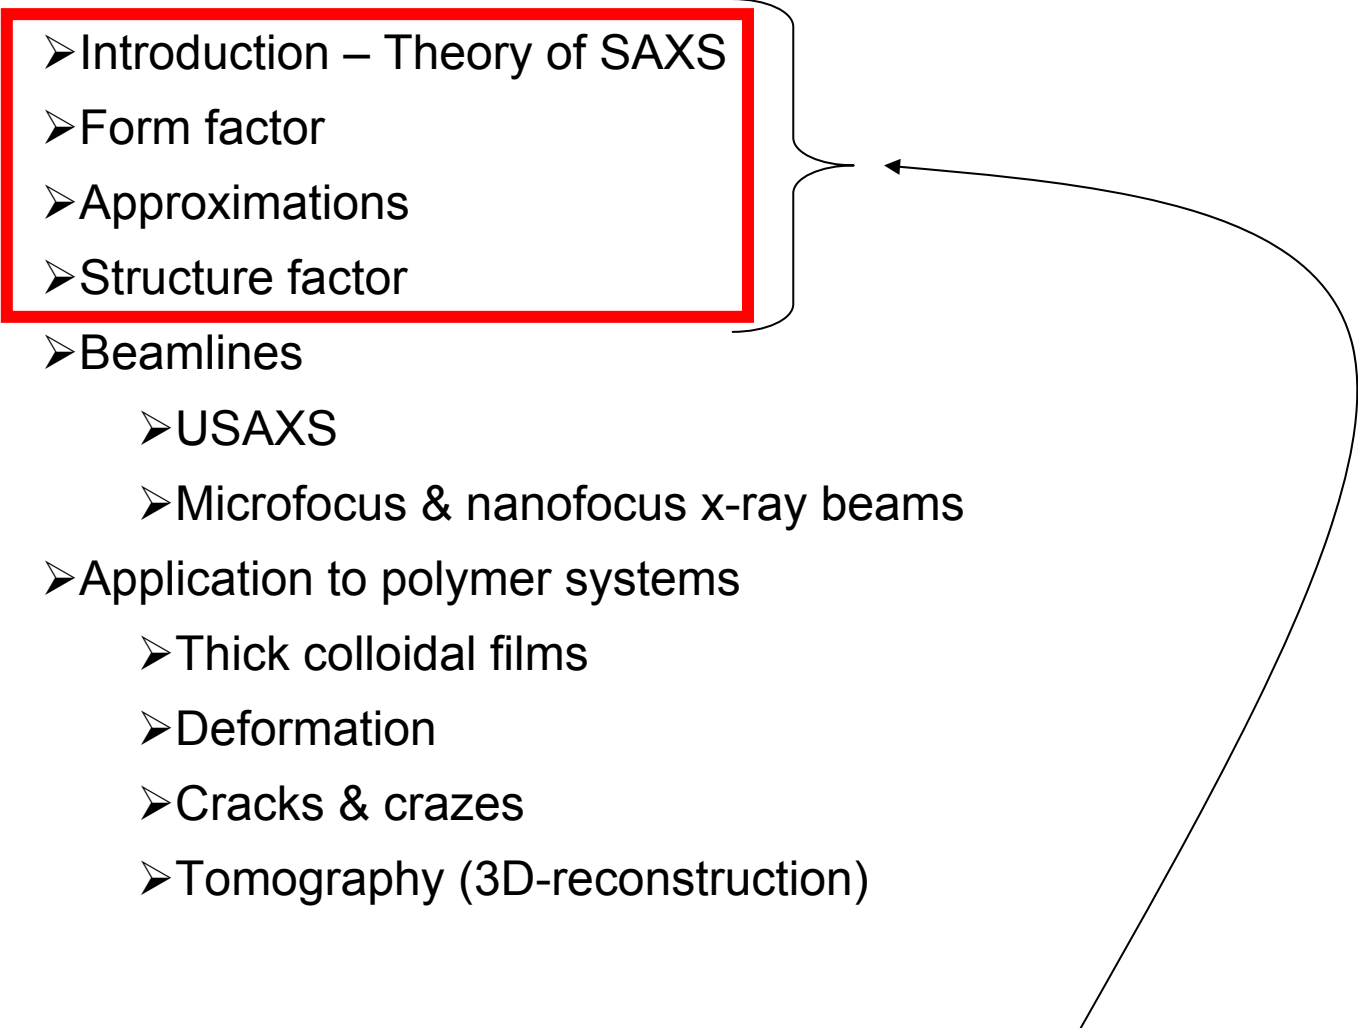

Colloids

Polymer-Metal nanocomposites

Following [Lindner] and R. Gehrke, „SAXS“, Summer student lectures 2008

# Small-angle X-ray scattering

A Note in advance

There are many formulas and derivations inside this lecture!

Our aim is NOT to follow in every detail the derivations etc., but more to explain the significance and practical application of these formulas!

# SAXS – rep. from lecture GG

Consider objects (nano-structures) of sub- $\mu\text{m}$  size

# Scattering geometry

$$I_{\text{scattered}} = I_0 N \Delta\Omega (d\sigma/d\Omega)$$

$I_0$ : incident intensity

$N$ : number objects

$\Delta\Omega$ : solid angle

$(d\sigma/d\Omega)$ : differential cross section

$$(d\sigma/d\Omega)/V = r_o^2 n (\rho_p - \rho_s)^2 v^2 F(Q) S(Q)$$

$n$ : volume fraction

$\rho$ : electron density

$v$ : particle volume

$F(Q)$  formfactor

$$F(Q) = \int d^3r \exp(i\mathbf{q}\mathbf{r}) \rho(\mathbf{r})$$

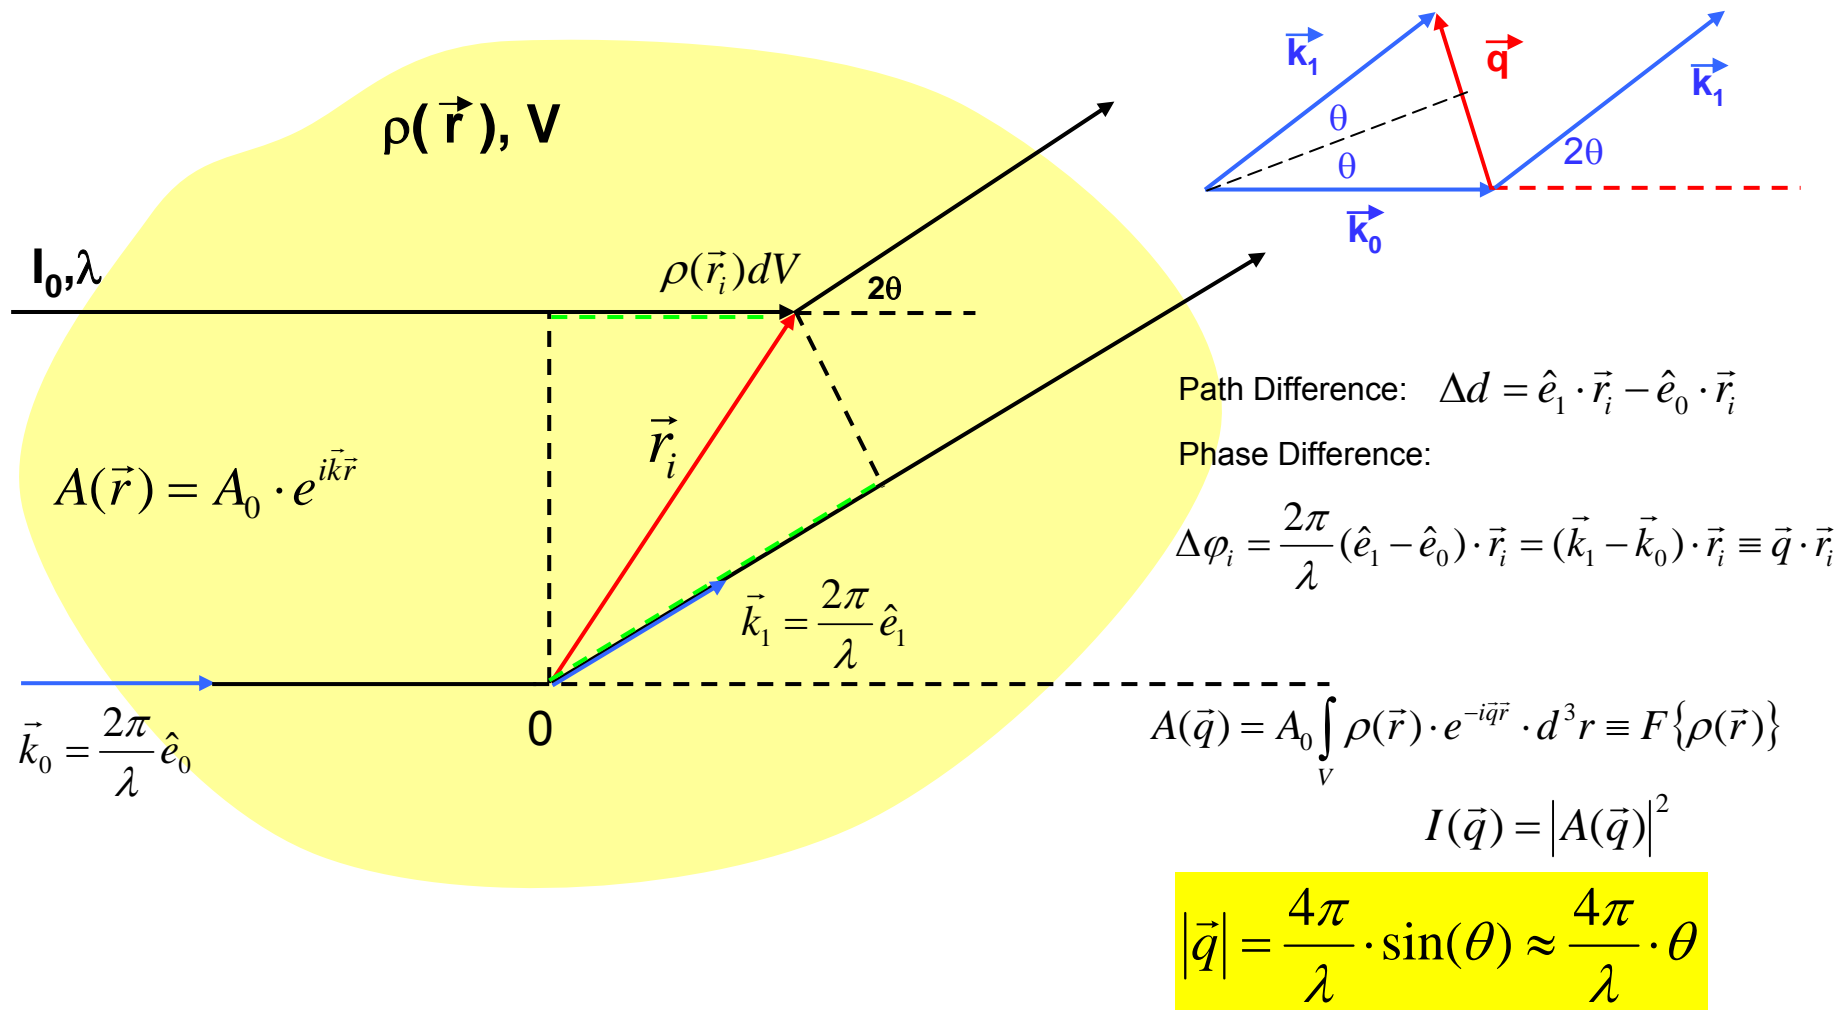

# Important approximations for Form factor

We will derive them, as they are frequently used:

- Guinier approximation
- Porod approximation

Single particle scattering, dilute Systems

# Form factor and structure factor

Single particle

$$\rho_p(\vec{r})$$

$$A(\vec{q}) = A_0 \int_V \rho(\vec{r}) \cdot e^{i\vec{q}\vec{r}} \cdot d^3r = F\{\rho(\vec{r})\} \equiv F(\vec{q})$$

Particle distribution function  $P(\vec{r}) \rightarrow$  Electron density distribution

$$\rho(\vec{r}) = \sum_i \rho_p(\vec{r}_i) = \int \rho_p(\vec{r}) \cdot P(\vec{r} - \vec{r}') \cdot d^3r' \equiv \rho_p(\vec{r}) * P(\vec{r})$$

$\rightarrow$  Scattering amplitudes of the whole arrangement

$$\begin{aligned} A(\vec{q}) &= F\{\rho(\vec{r})\} \\ &= F\{\rho_p(\vec{r}) * P(\vec{r})\} \\ &= F\{\rho_p(\vec{r})\} \cdot F\{P(\vec{r})\} \equiv F(\vec{q}) \cdot S(\vec{q}) \end{aligned}$$

$\rightarrow$  Scattered Intensity

$$I(\vec{q}) = |A(\vec{q})|^2 = \underbrace{|F(\vec{q})|^2}_{\text{Form factor}} \cdot \underbrace{|S(\vec{q})|^2}_{\text{Structure factor}}$$

Now let's take a closer look into  $F(q)$

# Single Particle Scattering in Dilute Systems

$$I_s = N \langle |F(\mathbf{q})|^2 \rangle$$

$$\text{with } F(\vec{q}) = \int_{V=\text{particleVolume}} \rho(\vec{r}) \cdot e^{-i\vec{q}\vec{r}} \cdot d^3r$$

Incoherent superposition of single particle scattering (S=1)

$$|F(\vec{q})|^2 = F(\vec{q}) \cdot F^*(\vec{q}) = \iint_V \rho(\vec{r}_1) \rho(\vec{r}_2) e^{-i\vec{q}(\vec{r}_1 - \vec{r}_2)} d\vec{r}_1 d\vec{r}_2$$

$$= \iint \underbrace{\rho(\vec{r}_1 - \vec{r}) \rho(\vec{r}_1)}_{\gamma(\vec{r})} d\vec{r}_1 e^{-i\vec{q}\vec{r}} d\vec{r}$$

substitute  $\mathbf{r}_1 - \mathbf{r}_2 = \mathbf{r}$

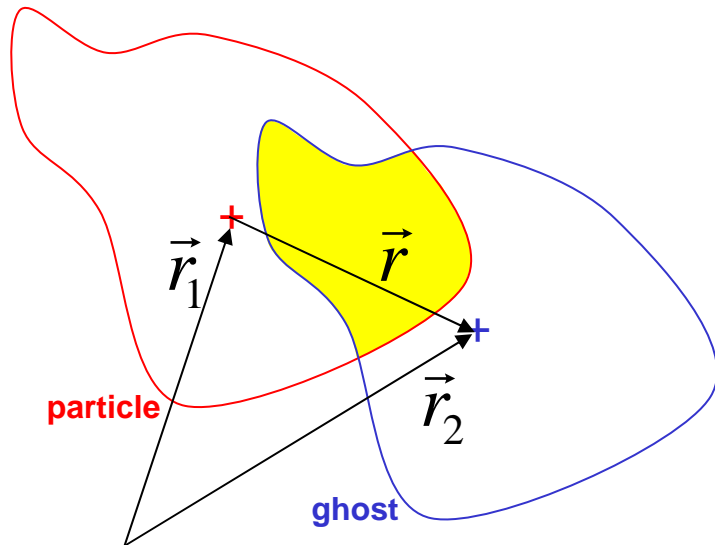

$$\gamma(\vec{r}) \equiv \int_V \rho(\vec{r}_1) \rho(\vec{r}_1 - \vec{r}) d\vec{r}_1$$

convolution square of the density distribution

$$\int \gamma(\vec{r}) e^{-i\vec{q}\vec{r}} d\vec{r} = \int \gamma(\vec{r}) e^{-i\vec{q}\vec{r}} d^3r$$

$$= \int \gamma(\vec{r}) e^{-iqr \cos(\theta)} r^2 \sin(\theta) d\theta d\phi dr$$

$$= \int \gamma(r) \frac{e^{iqr} - e^{-iqr}}{iqr} r^2 dr \cdot 2\pi \quad 2 \frac{\sin(qr)}{qr}$$

# Colloid: homogeneous sphere of radius R

A simple, but important calculation:

$$F(\vec{q}) = \int_{V=\text{particleVolume}} \rho(\vec{r}) \cdot e^{-i\vec{q}\vec{r}} \cdot d^3r = \int_0^R \int_0^{2\pi} \int_0^\pi \rho_0 \cdot e^{-i\vec{q}\vec{r}} r^2 \sin(\theta) d\theta d\varphi dr$$

$$F(\vec{q}) = \rho_0 2\pi \int_0^R \int_0^\pi e^{-iqr \cos(\theta)} r^2 \sin(\theta) d\theta d\varphi dr = \rho_0 2\pi \int_0^R \frac{e^{iqr} - e^{-iqr}}{qr} r^2 \sin(\theta) dr$$

$$F(\vec{q}) = \rho_0 2\pi \cdot \frac{2}{q} \int_0^R \sin(qr) r dr = \frac{4\pi\rho_0}{q} \left[ -\frac{r \cos(qr)}{q} \Big|_0^R + \int_0^R \frac{\cos(qr)}{q} dr \right]$$

$$F(\vec{q}) = \frac{4\pi\rho_0}{q} \left[ -\frac{R \cos(qR)}{q} + \frac{\sin(qR)}{q^2} \right] = 4\pi R^3 \rho_0 \frac{(\sin(qR) - qR \cos(qR))}{(qR)^3}$$

# Colloid: homogeneous sphere of radius R

See lecture 4 of GG

# Single Particle Scattering in Dilute Systems

For homogeneous particles  $\gamma(\mathbf{r})$  is just the overlapping volume

Average over all directions for a given  $r = |\mathbf{r}|$

$$I(q) = \langle |F(\vec{q})|^2 \rangle = 4\pi \int_0^\infty \gamma(r) \cdot r^2 \cdot \frac{\sin(qr)}{qr} \cdot dr$$

$\gamma(r) \cdot r^2 \equiv p(r) \equiv$  Pair Distance Distribution Function

# Guinier-Approximation

Two derivations: 1) From the formulas  
2) For polymer systems

$$I(q) = \langle |F(\vec{q})|^2 \rangle = 4\pi \int_0^\infty \gamma(r) \cdot r^2 \cdot \frac{\sin(qr)}{qr} \cdot dr \quad q \rightarrow 0 \quad \text{Forward scattering}$$

We use:  $\frac{\sin(qr)}{qr} = \frac{qr - \frac{1}{6}(qr)^3 + \dots}{qr} = 1 - \frac{1}{6}(qr)^2 + O((qr)^4)$  Taylor series expansion for  $qr \rightarrow 0$  or  $q \ll 1/r$  !

$$I(q) \approx 4\pi \int_0^\infty \gamma(r) \cdot r^2 \cdot \left(1 - \frac{1}{6}(qr)^2\right) \cdot dr = 4\pi \left( \int_0^\infty \gamma(r) \cdot r^2 dr - \int_0^\infty \gamma(r) \cdot r^2 \frac{1}{6}(qr)^2 dr \right)$$

$$I(q) = 4\pi \int_0^\infty \gamma(r) \cdot r^2 dr - 4\pi \frac{1}{3} q^2 \int_0^\infty \gamma(r) \cdot r^2 \frac{1}{2} r^2 dr = 4\pi \int_0^\infty \gamma(r) \cdot r^2 dr \cdot \left(1 - \frac{q^2 R_G^2}{3}\right)$$

$I(q=0)$

$$R_G^2 \equiv \frac{1}{2} \frac{\int_0^\infty \gamma(r) r^4 dr}{\int_0^\infty \gamma(r) r^2 dr}$$

$$I(q) = I(0) \cdot \left(1 - \frac{q^2 R_G^2}{3}\right) \approx I(0) \cdot e^{-\frac{q^2 R_G^2}{3}}$$

Radius of Gyration

$$R_G = \sqrt{\frac{1}{M} \sum_1^N \langle m_i \vec{r}_i^2 \rangle}$$

# Guinier approximation - spheres

$$I(q) = I(0) \cdot \exp\left(-\frac{1}{3} R_G^2 q^2\right)$$

$$\rightarrow \ln(I) = \ln I(0) - \frac{1}{3} R_G^2 \cdot q^2$$

Radius of Gyration  $R_g$

Monodisperse spheres of radius  $R$ :

$$R_g = \sqrt{3/5} \cdot R$$

# Guinier Approximation

$$\lim_{q \rightarrow 0} I(q) = \Delta\rho^2 \cdot V^2 \cdot \exp\left(-q^2 \cdot \frac{R_g^2}{3}\right)$$

Radius of Gyration  $R_g$

Monodisperse spheres of radius  $R=2\text{nm}$ :

$$R_g = \sqrt{3/5} \cdot R = 1.55\text{nm}$$

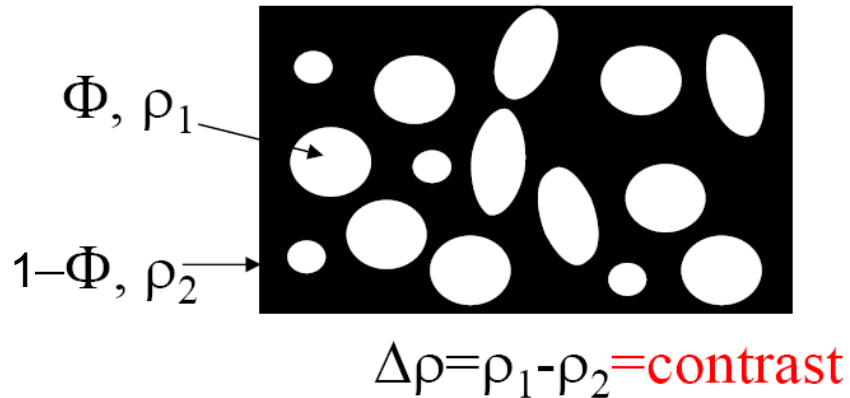

**2nm Colloids**  
**domains**

Very useful to get a hand on length scales!  
Sometimes only valid in limited  $q$ -range

# Porod's Theorems - I:

Two-phase system

$$\eta(\vec{r}) = \rho(\vec{r}) - \langle \rho \rangle$$

$$\langle \eta^2 \rangle = \langle \rho^2 \rangle - \langle \rho \rangle^2$$

Isotropic:

$$Q = \int I(q) q^2 dq = 2\pi^2 \cdot \Phi \cdot (1 - \Phi) \cdot (\Delta\rho)^2$$

$$F(\vec{q}) = \int_{\Phi V} \rho_1(\vec{r}) e^{-i\vec{q}\vec{r}} d^3r + \int_{(1-\Phi)V} \rho_2(\vec{r}) e^{-i\vec{q}\vec{r}} d^3r$$

$$F(\vec{q}) = \int_{\Phi V} (\rho_1 - \rho_2) e^{-i\vec{q}\vec{r}} d^3r + \rho_2 \int_V e^{-i\vec{q}\vec{r}} d^3r$$

$$F(\vec{q}) = \int_V \Delta\rho e^{-i\vec{q}\vec{r}} d^3r + \rho_2 \delta(\vec{q})$$

Only density fluctuation contribute to the measured signal at finite q:

$$I_m(\vec{q}) = I(\vec{q}) - \langle \rho \rangle^2 \delta(\vec{q})$$

$$Q \equiv \int I_m(\vec{q}) d^3q = (2\pi)^3 \langle \eta^2 \rangle$$

Q is called „invariant“ because it does not depend on the structure but only on volume fraction and contrast

# Porod's Theorems - I: Derivation

Total intensity: 
$$\int I(\vec{q}) d\vec{q} = \int d\vec{q} \int \gamma(\vec{r}) e^{-i\vec{q}\vec{r}} d^3 r = \int \gamma(\vec{r}) \delta(\vec{r}) d^3 r = \gamma(0)$$

$$\int I_m(\vec{q}) d\vec{q} I_m(\vec{q}) = \langle \rho^2 \rangle - \langle \rho \rangle^2$$

$$\gamma(0) \equiv \int_V \rho(\vec{r}_1) \rho(\vec{r}_1) d\vec{r}_1 = \langle \rho^2 \rangle$$

# Porod's Theorems - II: large $q$

Scattered intensity:  $\sim \left| 4\pi R^3 \rho_0 \frac{(\sin(qR) - qR \cos(qR))}{(qR)^3} \right|^2$

Look at maxima of form factor

$$\sim \left| 4\pi \rho_0 \frac{(\sin(qR) - qR \cos(qR))}{(q)^3} \right|^2$$

$$\leq \left( 4\pi \rho_0 \frac{|\sin(qR)| + qR |\cos(qR)|}{(q)^3} \right)^2$$

$$\sim \left( 4\pi \rho_0 \frac{1 + qR}{(q)^3} \right)^2 \sim \left( 4\pi \rho_0 \frac{qR}{(q)^3} \right)^2$$

$$\sim \frac{R^2}{(q)^4}$$

Surface of sphere

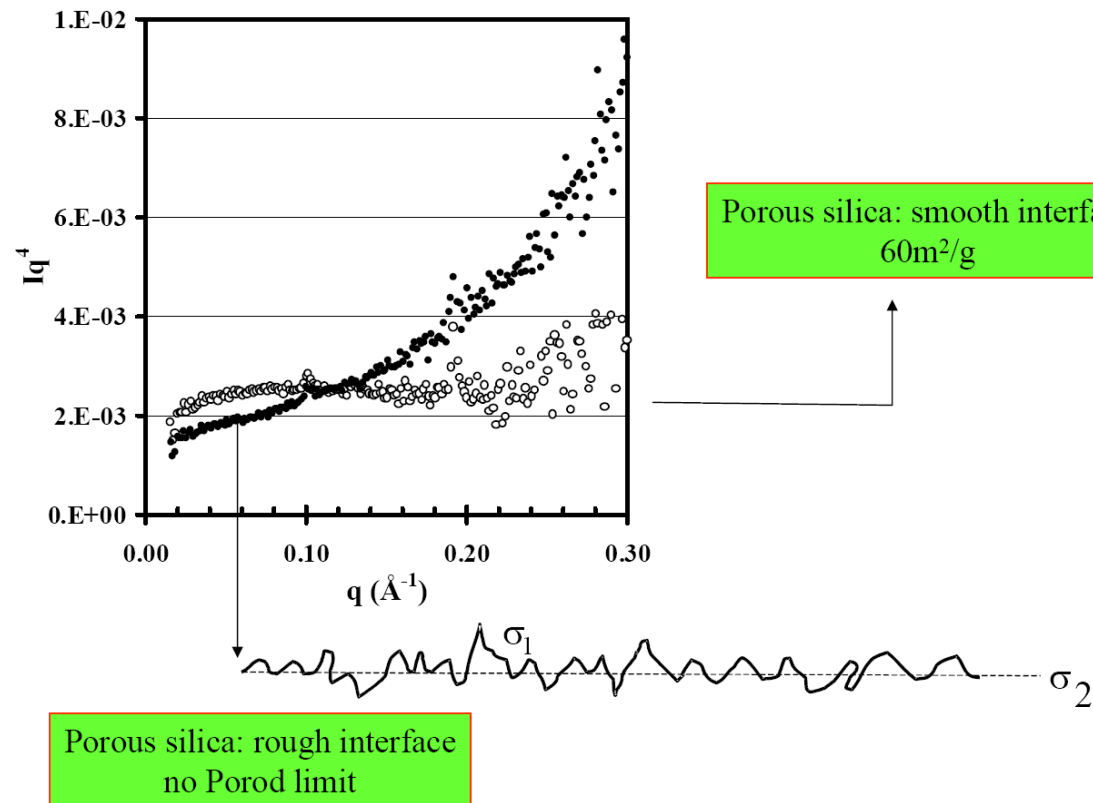

# General

Two phases with sharp interface

$$\lim_{q \rightarrow \infty} I(q) = \frac{2\pi(\Delta\rho)^2}{q^4} \cdot \frac{\sigma}{V}$$

For large  $q$  intensity decreases with  $q^{-4}$

Means to determine specific surface  $\sigma/V$

# Structure factor

Latex spheres

$$I(q) = S(q)P(q)$$

Low  $\phi$      $P(q)$   
 High  $\phi$      $S(q)P(q)$

Gaussian distribution of particle sizes

Shift in maximum:  
 Decreasing distance

# Structure factor

Latex spheres

$$I(q) = S(q)P(q)$$

$$q^* = 2\pi/\xi$$

Low  $\phi$   $P(q)$   
 High  $\phi$   $S(q)P(q)$

# SAXS-Tomography

Tomography => 3D reconstruction of objects

$$I_{\mathbf{q}}(r, \phi) = I_0 \int ds f(\phi, s, r) p_{\mathbf{q}, \phi}(x, y) g(\phi, s, r).$$

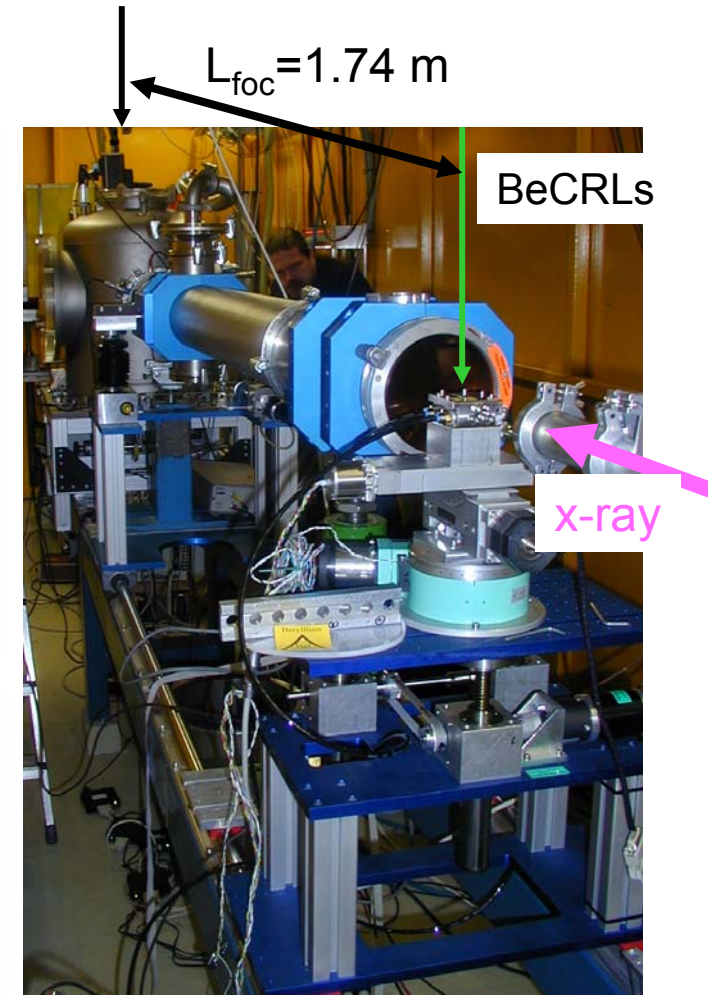

- Greek: *tomé* (cut) & *gráphein* (write, draw)
- Produce a virtual cut through object without actual slicing
- Mathematical technique for extracting a certain feature, e.g. absorption coefficient from the object, starting from integral of this feature.

# Tomographic Reconstruction of $\mu$ SAXS Pattern (BW4)

Irradiation direction of a volume element is **varied** step-by-step during the tomographic acquisition

top view of sample region

# Tomographic Reconstruction of $\mu$ SAXS Pattern (BW4)

Lupolen 6021D by BASF  
Beam size  $60 \times 30 \mu\text{m}^2$

# Results

For each translation and rotation  $(r, \phi) \Rightarrow$  one value for  $I_q(r, \phi)$

Solve system of linear equations to extract  $p_{q, \phi}$

$$I_q(r, \phi) = I_1 \int ds p_{q, \phi} [x(s, r), y(s, r)] \sim \sum_k p_{q, \phi_j} [x(s_k, r_j), y(s_k, r_j)]$$

SAXS cross section

attenuation

scattered intensity

$q = 1 \text{ nm}^{-1}$

Integral of curve = grey scale

# Results

# Guinier-Approximation – for polymer systems

$$R_G = \sqrt{\frac{1}{M} \sum_1^N \langle m_i \bar{r}_i^2 \rangle} \quad \text{Say } M=N \text{ } M_0 \quad R_G^2 = \frac{1}{N} \sum_1^N \langle \bar{r}_i^2 \rangle = \frac{1}{N} \sum_1^N \langle (\bar{r}'_i - \bar{r}_{CM})^2 \rangle$$

$$\bar{r}_{CM} = \frac{1}{N} \sum_1^N \langle \bar{r}_i \rangle \Rightarrow R_G^2 = \frac{1}{N} \sum_{i=1}^N \left\langle \left( \bar{r}'_i - \sum_{j=0}^N \bar{r}'_j \right)^2 \right\rangle$$

$$\Rightarrow R_G^2 = \frac{1}{2N^2} \sum_{j,i=1}^N \underbrace{\langle (\bar{r}'_i - \bar{r}'_j)^2 \rangle}_{|j-i|a^2} \quad a \sim \text{mean length}$$

Point-like colloid=segment,  $\delta$ -scatterers, N segments

$$\langle |F(\vec{q})|^2 \rangle = \iint_V \rho(\vec{r}_1) \rho(\vec{r}_2) e^{-i\vec{q}(\vec{r}_1 - \vec{r}_2)} d\vec{r}_1 d\vec{r}_2$$

Replace integral by discrete sum:  $\langle |F(\vec{q})|^2 \rangle = \frac{1}{N} \sum_{j,k=1}^N \langle e^{-i\vec{q}(\vec{r}_j - \vec{r}_k)} \rangle$

# Guinier-Approximation – for polymer systems

$$\langle |F(\vec{q})|^2 \rangle = \frac{1}{N} \sum_{j,k=1}^N \langle e^{-i\vec{q}(\vec{r}_j - \vec{r}_k)} \rangle \approx \frac{1}{N} \sum_{j,k=1}^N \left\langle \left( 1 - i\vec{q}(\vec{r}_j - \vec{r}_k) - \frac{1}{2} |\vec{q}(\vec{r}_j - \vec{r}_k)|^2 \right) \right\rangle$$

$\downarrow$   
 $\langle \dots \rangle \rightarrow 0$

$$\langle |\vec{q}(\vec{r}_j - \vec{r}_k)|^2 \rangle = |q^2| \underbrace{\langle |\vec{r}_j - \vec{r}_k|^2 \cos(\theta)^2 \rangle}_{\text{Only r-dependence, no } \theta\text{-dependence}} = \frac{1}{3} q^2 \langle |\vec{r}_j - \vec{r}_k|^2 \rangle$$

Only r-dependence, no  $\theta$ -dependence

$$\begin{aligned} \langle |F(\vec{q})|^2 \rangle &= \frac{1}{N} \sum_{j,k=1}^N \left( 1 - \frac{1}{6} q^2 \langle |\vec{r}_j - \vec{r}_k|^2 \rangle \right) \\ &= \frac{1}{N} \left( N^2 - \frac{1}{3} q^2 \frac{1}{2} \sum_{j,k=1}^N \langle |\vec{r}_j - \vec{r}_k|^2 \rangle \right) \end{aligned}$$

$$\langle |F(\vec{q})|^2 \rangle = \underbrace{\frac{1}{N} N^2}_{I(q=0)} \left( 1 - \frac{1}{3} q^2 \underbrace{\frac{1}{2N^2} \sum_{j,k=1}^N \langle |\vec{r}_j - \vec{r}_k|^2 \rangle}_{R_G^2} \right)$$
